

# Project Document for CrazyPages

---

**Author:** Zheng Hanwen

**StudentID:** 1853931

**Tutor:** Liu Yan

---

## 1. Abstraction

---

This document is a project document for the assigned individual project for Web Service & SOA course. It's written as an entertainment auxiliary for every single person, especially who surf the Internet a lot. For some objective reasons, the theme of my project has changed after the project proposal submitted. This document aims to draw a brief illustration of CrazyPages and make it easier to learn about its technology stack. This proposal is divided into 5 parts mainly. The first part introduces the design concept and practicality of CrazyPages, in addition to some operation guides. Then the second part demonstrates the architecture of the project, divided by the front-end and the back-end design. The third lists all the web-apis I've used, demonstrates all the apis that I design and achieve, and explains the integration. The fourth part demonstrates a few screenshots of my project. The last part instructs readers to set up environment and precondition in order to run the whole project.

## 2. Brief Introduction

---

CrazyPages is a product made by a crazy programmer( yey, that's me), to provide precious entertainment for high-speed living people and high-pressurers. I try my best to make the front-end pages cute and active. They may make you smile and also learn some interesting facts. Hope my project bring you a good day!

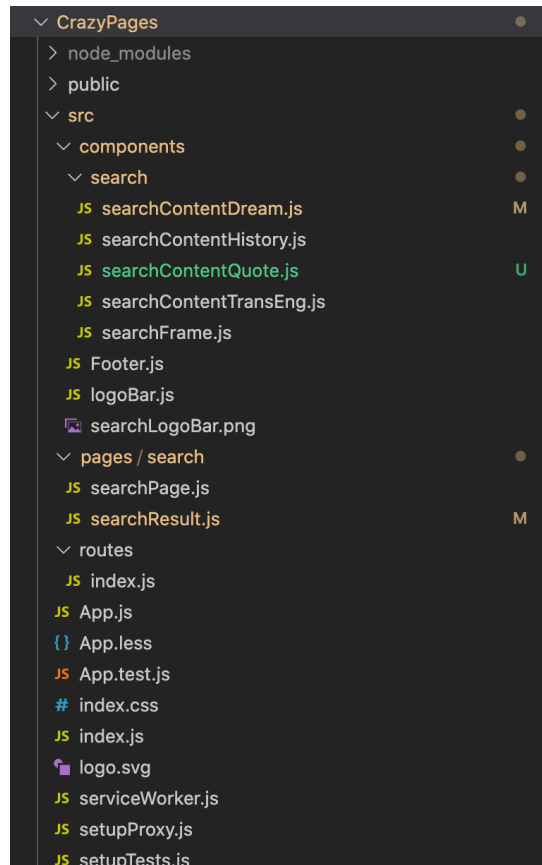

## 3. Architecture

---

### 3.1 Front-end

#### 3.1.1 Introduction

My front-end part is based on a react scaffolding. React basically helps to distribute task into lower levels and realize easier data fetching and access. The structure is listed as below.

### 3.1.2 Structure

- node\_modules: dependency file, fine to be added into git.ignore
- public: openly access files
- src: edit your 90% codes here
- index.js => load some global scripts and start a react app
- **component** => including views and logical controller of the elements of frontend web pages
- pages: including more direct rendering of pages
- **routes** => **index.js** ==> package React routes to jump to a certain path and define mine
- craco.config.js => realize the global configuration of UI component library such as change theme color
- setupProxy.js => import http-proxy-middleware and set up my Proxy agent

### 3.1.3 Most Used Libraries

1. ant-design UI
2. axios
3. proxy
4. jquery

### 3.1.4 Essential Code Pics

JS index.js ×

CrazyPages > src > routes > JS index.js > ...

```
1  import SearchPage from "../pages/search/searchPage";
2  import SearchResult from "../pages/search/searchResult";
3
4
5  export const mainRoutes = [{
6    path: "/search",
7    title: "搜索页面",
8    component: SearchPage
9  },
10 {
11   path: "/searchResult/:kw",
12   title: "搜索结果页面",
13   component: SearchResult
14 }]
```

pic1: set routes

```

import LogoBar from '../../components/logoBar'
import SearchContentQuote from '../../components/search/searchContentQuote'
import SearchContentTransEng from '../../components/search/searchContentTransEng'
import { Row, Col, Layout, PageHeader, Card } from 'antd';

export default class SearchResult extends Component {
  render() {
    return (
      <div>
        <PageHeader
          className="site-page-header"
          onBack={() => this.props.history.goBack()}
          title="还想搜? "
          subTitle="好吧那你搜吧"
        />
        <LogoBar />
        <Row>
          <Col span={12} offset={7}>
            <SearchContentTransEng />
          </Col>
        </Row>
        <Layout style={{ margin: '2% 8% 5% 8%', backgroundColor: 'white' }}>
          <Row>
            <Col span={12}>
              <Card>
                <SearchContentQuote />
              </Card>
            </Col>
            <Col span={12}>
              <Card>
                <SearchContentDream />
              </Card>
            </Col>
          </Row>
        </Layout>
        <Footer />
      </div>
    )
  }
}

```

```

JS searchPage.js × JS searchResult.js
CrazyPages > src > pages > search > JS searchPage.js > ...
1  import React, { Component } from 'react'
2  import { Layout } from 'antd'
3  import SearchFrame from '../../../components/search/searchFrame'
4  import LogoBar from '../../../components/logoBar'
5  import Footer from '../../../components/Footer'
6  import SearchContentHistory from '../../../components/search/searchContentHistory'
7
8  export default class SearchPage extends Component {
9      render() {
10         return (
11             <div >
12                 <LogoBar/>
13                 <SearchFrame/>
14                 <Layout style={{ margin: '5% 8% 5% 8%' }}>
15                     <SearchContentHistory/>
16                 </Layout>
17                 <Footer/>
18             </div>
19         )
20     }
21 }

```

pic3: SearchPage Component design

```
JS searchPage.js    JS searchFrame.js X    JS searchResult.js
CrazyPages > src > components > search > JS searchFrame.js > ...
1  import React, { Component } from 'react'
2  import { Input, Layout } from 'antd';
3
4  const { Search } = Input;
5
6  export default class SearchFrame extends Component {
7
8      constructor(props) {
9
10         super(props)
11         this.state = {
12             kw: this.props.kw
13         }
14     }
15
16     inputChange(e){
17         this.setState({
18             kw: e.target.value
19         })
20         console.log(this.state.kw)
21     }
22
23     keyDown(e){
24         if(e.keyCode === 13){
25             }
26     }
27
28     searchJump(value){
29         console.log(this.state.kw)
30         window.location.hash=`#/searchResult/${this.state.kw}`
31     }
32
33 }
```

```
render() {
    return (
        <div style={{ marginLeft: '25%', backgroundColor: 'white' }}>
            <Layout style={{ backgroundColor: 'white' }}>
                <Search
                    placeholder="这是一个无聊的网站，不要在这里搜索任何东西！"
                    style={{ width: '65%' }}
                    enterButton="Search"
                    size="large"

                    value={this.state.kw}
                    onSearch={value => this.searchJump(value)}
                    //onKeyDown={e=>this.keyDown(e)}
                    onChange={this.inputChange.bind(this)}
                />
            </Layout>
        </div>
    )
}
```

pic4-5: SearchFrame Component design

```

export default class SearchContentTransEng extends Component {
  constructor(props) {
    super(props);
    this.state = {
      keyword: window.location.hash.slice(15),
      data: []
    };
  }
  componentDidMount(){
    Axios
      .get(`https://api.66mz8.com/api/translation.php?info=`+this.state.keyword)
      .then((res) => {
        console.log('res2:', res.data)
        var result=res.data
        this.setState({data:result})
      })
      .catch(function (error) {
        console.log(error)
      })
  }
  componentWillUnmount = () => {
    this.setState = (state,callback)=>{
      return;
    };
  }
  render() {
    //初始化render数组状态
    let objArr=this.state.data
    return(
      <Layout>
        <PageHeader
          className="site-page-header"
          ghost={false}
          title={"首先我知道你搜索的意思是\""+objArr.fanyi+"\""}
          subTitle="我英语比你强多了（狗头） "
        />
      </Layout>
    )
  }
}

```

pic6: SearchContentTransEng Component design, including fetch data through web-api by the way of URL

CrazyPages > src > components > search > JS searchContentHistory.js > ...

```
1  import React, { Component } from 'react'
2  import { Layout, List, PageHeader } from 'antd';
3  import axios from 'axios'

                className="site-page-header"
                ghost={false}
                title="我打赌你不知道....."
                subTitle="历史上的今天发生了这些事! "
            />
            <List
                itemLayout="horizontal"
                dataSource={objArr.data}
                style={{ marginLeft: '20px', marginTop: '5px' }}
                split={true}
                grid={{ column:'2', gutter: '2px'}}
                renderItem={item => (
                    <List.Item>
                        <List.Item.Meta
                            title={
                                <a href={item.link}>
                                    {item.title}
                                </a>
                            }
                            //昵称
                            description={`'公元'+item.year+'年'+this.state.myData.month+'月'+this.state.myData.day+'日'}`}
                            //账号
                        />
                    </List.Item>
                )}
            />
        </Layout>
    )
}
```

pic7-8: SearchContentHistory Component design, including fetch data through my api by agent name

```
render() {  
  //初始化render数组状态  
  let objArr=this.state.myData  
  if(objArr!==null){  
    return(  
      <Layout>  
        <PageHeader  
          className="site-page-header"  
          ghost={false}  
          title="最后我还熟读《周公解梦》，昨晚梦见这个啦？"  
          subTitle="想不到吧"  
        />  
        <List  
          itemLayout="vertical"  
          dataSource={objArr}  
          style={{ margin: '0 20px 0 20px' }}  
          split={true}  
          renderItem={item => (  
            <List.Item>  
              <List.Item.Meta  
                title={`如果你梦到"${item.title}"`}   
                description={item.des}  
              />  
              <Divider />  
            </List.Item>  
          )}  
        />  
      </Layout>  
    )  
  }  
}
```

```

    else return(
      <Layout>
        <PageHeader
          className="site-page-header"
          ghost={false}
          title="最后我还熟读《周公解梦》，昨晚梦见这个啦？"
          subTitle="想不到吧"
        />
        <Empty
          style={{margin: '10px'}}
          description="被你逮到了，我确实不知道"
        >
        </Empty>
      </Layout>
    )
  }
}

```

pic9-10: SearchContentDream Component design, featuring fault-tolerance assurance with rendering empty status

Below is my XmlToJson function:

```

// 调用函数将XML转换为JSON
function XmlToJson() {
}
XmlToJson.prototype.setXml = function(xml) {
  if(xml && typeof xml == "string") {
    this.xml = document.createElement("div");
    this.xml.innerHTML = xml;
    this.xml = this.xml.getElementsByTagName("*")[0];
  }
  else if(typeof xml == "object"){
    this.xml = xml;
  }
};
XmlToJson.prototype.getXml = function() {
  return this.xml;
};
XmlToJson.prototype.parse = function(xml) {
  this.setXml(xml);
  return this.convert(this.xml);
};

```

```

XmlToJson.prototype.convert = function(xml) {
    if (xml.nodeType !== 1) {
        return null;
    }
    var obj = {};
    obj.xtype = xml.nodeName.toLowerCase();
    var nodeValue = (xml.textContent || "").replace(/(\r|\n)/g,
    "").replace(/^\s+|\s+$/g, "");
    if (nodeValue && xml.childNodes.length === 1) {
        obj.text = nodeValue;
    }
    if (xml.attributes.length > 0) {
        for (var j = 0; j < xml.attributes.length; j++) {
            var attribute = xml.attributes.item(j);
            obj[attribute.nodeName] = attribute.nodeValue;
        }
    }
    if (xml.childNodes.length > 0) {
        var items = [];
        for (var i = 0; i < xml.childNodes.length; i++) {
            var node = xml.childNodes.item(i);
            var item = this.convert(node);
            if (item) {
                items.push(item);
            }
        }
        if (items.length > 0) {
            obj.items = items;
        }
    }
    return obj;
};

```

## 3.2 Back-end

### 3.2.1 Introduction

My back-end part is based on Python Flask. I've learned how to use Flask to finish enough requirements for my project just for one night and finally realize everything necessary. Python Flask is agile, efficient and practical. And it's so suitable for this assignment. The structure is listed as below.

### 3.2.2 Structure

in main.py, you will first find dependencies imported such as flask, flask\_cors (to solve CORS problems), requests.

```
# r'/*' 是通配符, 让本服务器所有的URL 都允许跨域请求
CORS(app, resources=r'/*')
```

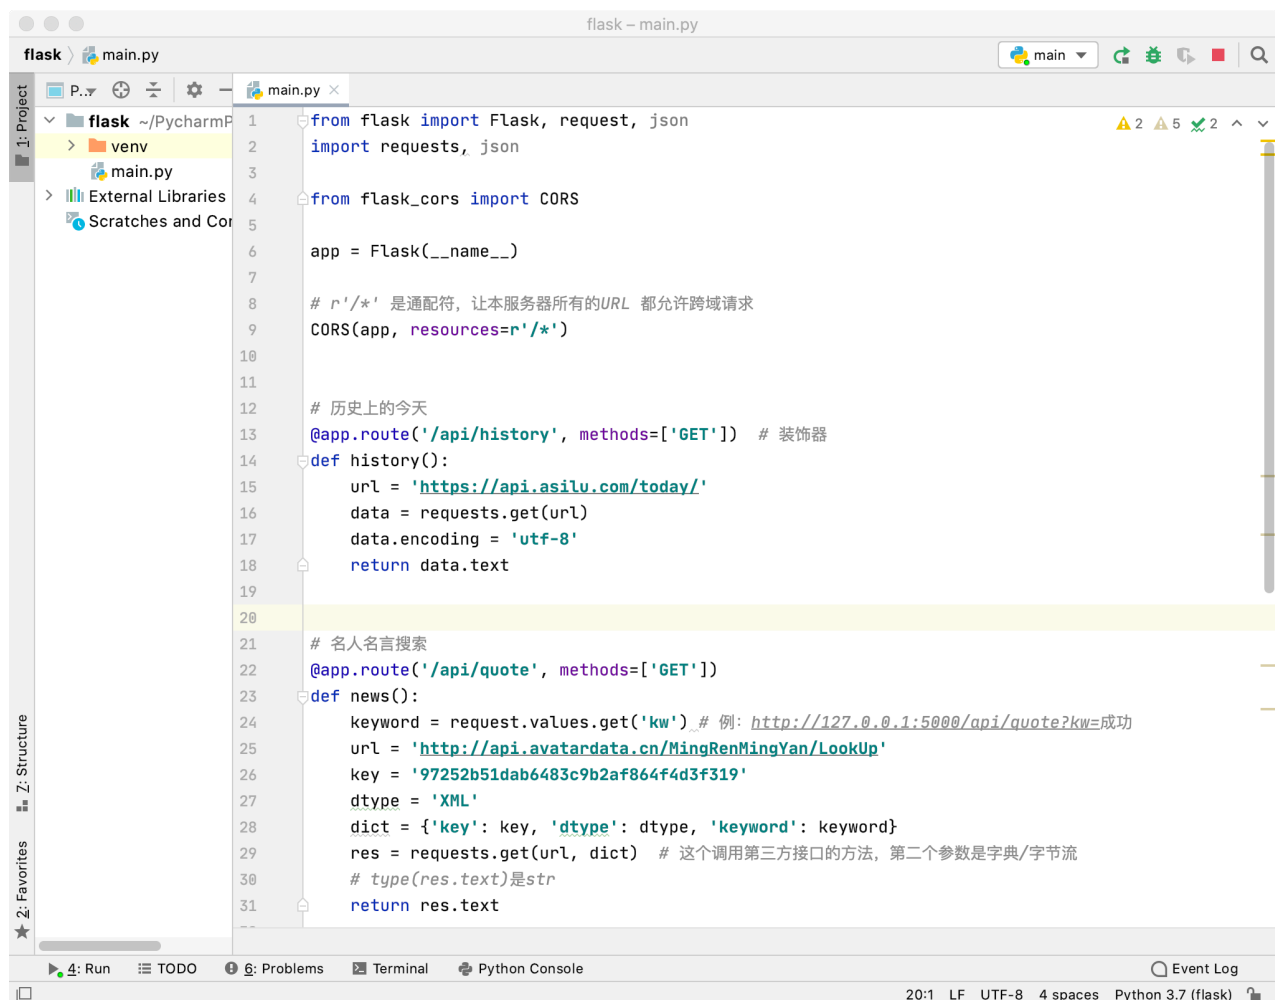

Above allows all URLs on this server to allow cross-domain requests.

Then I bind functions to a route and define the methods of data requesting. If there need to be some parameters I use request.value.get(), then pass on to call for web-apis and return data after encoding (to controll the format). And if there is key needed for a certain web-api (the key should be acquired by myself from their platform), I will wrap the api fine and cut the number of parameters to keep it easy.

```
if __name__ == '__main__':
    app.run(debug=True)
```

Finally app.run. Keep the back-end server working and then test all my api at the front-end. They all work out.

### 3.2.3 Essential Code Pics

```

# 周公解梦
@app.route('/api/dream', methods=['GET'])
def dream():
    keyword = request.values.get('kw') # 例: http://127.0.0.1:5000/api/dream?kw=黄金
    url = 'http://v.juhe.cn/dream/query'
    key = 'c5179ebd54f625613902bc6660d4b1b5'
    dict = {'key': key, 'q': keyword}
    res = requests.post(url, dict)
    res.encoding = 'utf-8'
    # type(res.text)是str
    return res.text

if __name__ == '__main__':
    app.run(debug=True)

```

## 4. Apis and Intergration

### 4.1 All of the web-apis I used

src	BaseURL	Data Format	Note
简爱API	<a href="https://api.asilu.com/today">https://api.asilu.com/today</a>	json	历史上的今天
阿凡达数据	<a href="http://api.avatardata.cn/MingRenMingYan/LookUp">http://api.avatardata.cn/MingRenMingYan/LookUp</a>	xml	名人名言查询
Kate-API	<a href="https://api.66mz8.com/api/translation.php">https://api.66mz8.com/api/translation.php</a>	json	中英互译
聚合数据	<a href="http://ip.taobao.com/service/">http://ip.taobao.com/service/</a>	json	周公解梦查询

### 4.2 My Apis

Method	Api	Note
GET	/api/history	Get today's history affairs.
GET	/api/quote?kw	Get the relevant famous sayings list searched by a certain keyword.
GET	/api/dream?kw	Get the detaied dream analysis list searched by a certain keyword.

## 4.3 Intergration

### Back-end:

```
@app.route('/api/dream', methods=['GET'])
def dream():
    keyword = request.values.get('kw') # 例: http://127.0.0.1:5000/api/dream?kw=
    黄金
    url = 'http://v.juhe.cn/dream/query'
    key = 'c5179ebd54f625613902bc6660d4b1b5'
    dict = {'key': key, 'q': keyword}
    res = requests.post(url, dict)
    res.encoding = 'utf-8'
    # type(res.text)是str
    return res.text
```

### Front-end:

```
var url = '/dream?kw=' + this.state.keyword
axios.get(url).then((res) => {
    console.log('res3:', res.data)
    var result=res.data.result
    this.setState({myData:result})
})
```

```
render() {
    //初始化render数组状态
    let objArr=this.state.myData
    if(objArr!==null){
        return(
            <Layout>
                <PageHeader
                    className="site-page-header"
                    ghost={false}
                    title="最后我还熟读《周公解梦》，昨晚梦见这个啦？"
                    subTitle="想不到吧"
                />
                <List
                    itemLayout="vertical"
                    dataSource={objArr}
                    style={{ margin: '0 20px 0 20px' }}
                    split={true}
                    renderItem={item => (
                        <List.Item>
                            <List.Item.Meta
                                title={'如果你梦到'+item.title+''}
                                description={item.des}
                            />
                        </List.Item>
                    )
                />
            </List>
        )
    }
```

```

        />
        <Divider />
      </List.Item>
    )}
  />
</Layout>
)
}
else return(
  <Layout>
    <PageHeader
      className="site-page-header"
      ghost={false}
      title="最后我还熟读《周公解梦》，昨晚梦见这个啦？"
      subTitle="想不到吧"
    />
    <Empty
      style={{margin: '10px'}}
      description="被你逮到了，我确实不知道"
    >
    </Empty>
  </Layout>
)
}

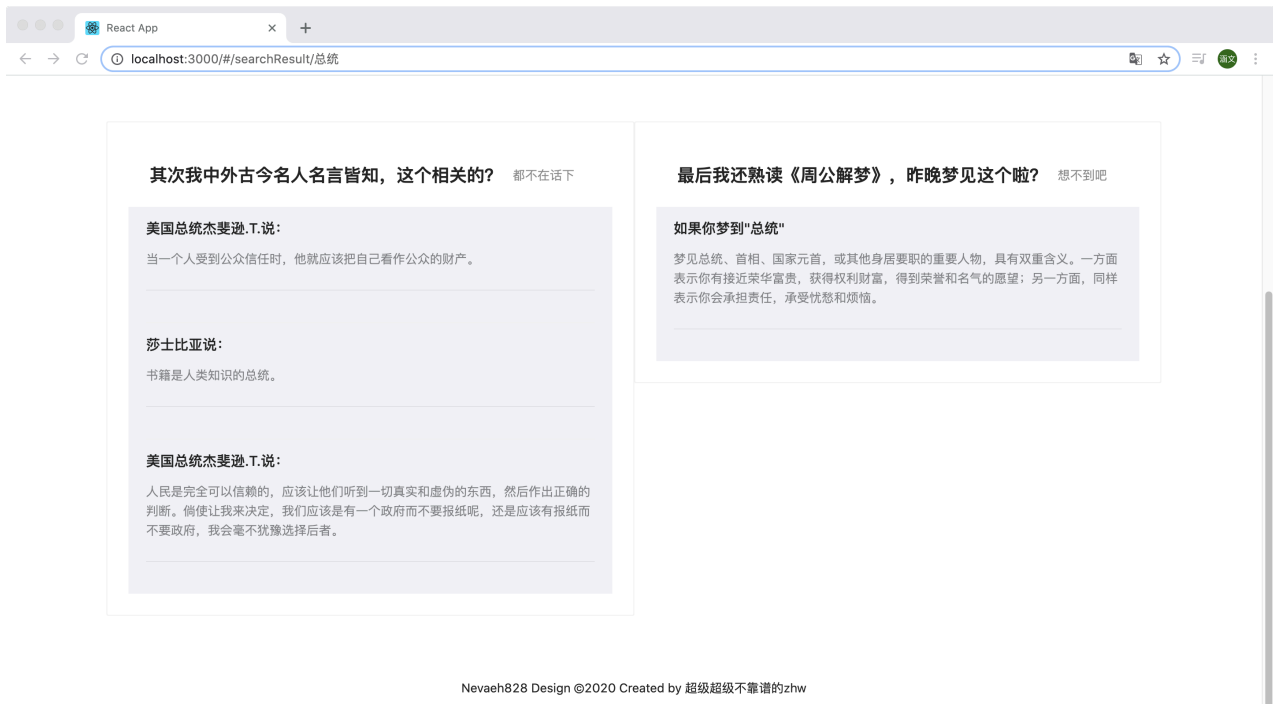

```

## 5. Screenshots

## 6. Background Setup Instruction

### Front-end background

```
npm -v
yarn -v
node -v
git --version

# antd
npm i antd
yarn add craco-less

# 路由
npm i react-router-dom

# Proxy 代理
yarn add http-proxy-middleware

# 启动
cd Web_Service_SOA
cd CrazyPages
npm start
```

## Back-end background

```
pip install flask
pip install requests
pip install flask_cors
.....

python flask.py
```

By the way, the project has been tracked in my GitHub repository(link below). You can see my follow-up development and improvement.
